                                         -i- FUNCTION: DNA POLYMÉRASE III IS A COMPLEX, MULTICHAIN ENZYME RESPONSITE FOR MOST OF THE REPLICATIVE SYNTHESIS IN BACTERIA.

THIS DNA POLYMERASE ALSO FYHIRITS 3 TO 5' EXONGLEASE ACTIVITY.

THE ALPHA CHAIN IS THE DNA POLYMERASE (BY SIMILARITY).

-i- GATALYTIC ACTIVITY: N deoxynucleoside triphosphate - N diphosphate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CHAINS) THAT ASSOCIATES WITH A TAU SUBUNIT WHICH ALLOW THE CORE DIMERIZATION TO FORM THE POLITY COMPLEX POLITY ASSOCIATES WITH THE GAMMA COMPLEX, COMPOSED OF CHAINS GAMMA, DELTA, DELTA', FSI, AND CHI) AND WITH THE BELL OF CHAIN SHILLARITY.

SUBCELLULAR LOCATION. CYLY LASHIC (BY SIMILARITY).

SIMILARITY. BELONGS TO THE DNA POLYMERASE IYPE-C FAMILY. DNAL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Tomb J.-F., White O., Kerlavage A.R., Clayton R.A., Sutton G.G., Fleischmann P.D., Ketchum K.A., Klenk H.-P., Gill S., Deugherty B.A., Nelson K., Quackenbush J., Zhou L., Kirkness E.F., Peterson S., Loftus B., Richardson D., Dedson P., Khalak H.G., Glodek A., McKenney K., FitzGerald L.M., Lee N., Adams M.D., Hickey E.K., Berg D.E., Gocayne J.D., Utterback T.R., Peterson D., Kenley J.M., Cotton M.D., Weldman J.M., Fujil C., Bowman C., Watthey L., Wallin E., Hayes W.S., Borodovsky M., Karp P.D., Smith H.O., Fraser C.M.,
